Compilation The compiler converts the source code in a file into the Irie Pascal byte code that is then run by the interpreter. Irie Pascal includes a compiler that supports the following Pascal language features: ? Control Structure (including for/next) ? Declarations of all data types (except arrays) ? Declarations of all procedures and functions (including exception declarations) ? Modules ? Input/Output

Therefore, Irie Pascal only works with files that are less than 4K in size. "Irie Pascal" also stands for "Irie Platform" (which is short for "Irie Platform for Internet Application Design"). However, Irie Pascal does not stand for a platform in the technical sense. It is a set of

A **KEYMACRO** is a C-preprocessor macro that enables programmers to define constants (primarily **MACROs**), which are replaced with pre-defined values when the program is compiled. For example, if you want to define a constant with the value "This is a very big program", you would use **KEYMACRO** to define the

---

following: #define LONGBSIZE + 10000 When you compile this program, the constant will be replaced by the pre-defined value 10000, which in this case is defined in standard Pascal as a constant with the value 10000. KEYMACRO's are particularly useful for defining constants that are not easily defined as literal numbers in the source code, such as application names, vendor names, etc. KeyMACRO is also useful for creating macros that are not easily defined in standard

---

Pascal, such as building large repetitive strings, or constant strings. KEYMACRO is not a pre-processor, because it does not compile or interpret program source code. How to use

**KEYMACRO:** KEYMACRO can be used in any statement in Pascal (as opposed to Standard Pascal, which limits KEYMACRO to IF or WHILE statements)

KEYMACRO takes the form:

KEYMACRO( [ , ] [ : ] [ , ] [ : ]... [ , ]... ) The name is the name of the constant that you are defining, the

---

is the string you are defining the constant with, and the is the type of the constant. For example, to define a constant with the value "Apples", the following KEYMACRO is used: #define APPLES Apples If you want to define several different constants with the same name, you can use a comma to separate each constant, e.g. the following KEYMACRO defines the values "Apples", "Bananas", and "Oranges" in the variable apples, bananas, and oranges: #define

---

APPLES, Apples, Bananas,  
Oranges To define a constant with  
a variable that is not an  
expression, you can use an equal  
sign: #define APPLES = Apples  
The and values are passed to the  
KEYMACRO as strings and as  
types. Two types of constants are  
defined using KEYMACRO: ?  
Static constants: These constants  
remain constant throughout the  
program, and can be 1d6a3396d6

Irie Pascal is an implementation of the Pascal programming language. The Pascal language is a general purpose programming language developed by Niklaus Wirth in 1968, which has become a de-facto standard for many classes of applications. Irie Pascal compiles the Standard Pascal programming language, which is based on the original Pascal language developed by Niklaus Wirth in 1968. Most of the

---

standard Pascal language features are supported by Irie Pascal, but there are some limitations to this implementation. "Irie Pascal is a compiler and interpreter written in Java. It aims to port the Pascal programming language to a more modern architecture by supporting the full Standard Pascal language, with some extensions (such as string and file/directory processing) written in Java, as well as its own extensions. The language includes several features that make the implementation

---

easier than is usually required for an interpreter: • Irie Pascal is a bytecode interpreter, so it can run programs very quickly. This makes it ideal for applications where the user does not want to wait for programs to compile, but where programs need to be run quickly and then discarded. • Irie Pascal is a non-strict language, so the interpreter does not make any assumptions about the validity of the program. • The compiler supports an optional optimizer, which tries to make programs run

---

faster by removing unnecessary code. Irie Pascal supports an old and new style of programming. An old style program is a sequence of statements in Pascal. New style programs are the common use case for Irie Pascal, where the program consists of declaring and using methods and procedures. A method declaration is one of the two main parts of a new style program. It is used to indicate the names and types of the arguments that a method will take and the names and types of

---

the return values of the method. A procedure is a nested method. A procedure can have zero or more procedure declarations, and it can return a value (for instance, an integer). Irie Pascal supports the following extensions to Standard Pascal:

- A method can have a procedure as one of its arguments. The return type of the method is the result of the procedure that it calls.
- A procedure can return a procedure (or a method), which has the same types as the procedure (or method) that called

---

it. • Procedure names are case sensitive. • A method can have a procedure as one of its arguments. The return type of the method is the result of the procedure that
